System

The team has decided to do a carwash management system.

Description of System

The carwash management system will be a program that allows a business manager or owner to manage their business with more ease.

The program will keep track of appointments for their clients. It will allow a user to create an appointment on a calendar that holds the client's name, their requested service, and the time requested. To create an appointment the user will be able to navigate to the menu that is labeled "Appointments". There will then be options to create, delete, and edit appointments.

In addition to creating appointments the program will also give the user an opportunity to record sales and revenue. The user will be able to view the company's sales and revenue over different intervals. The user will be able to add

sales by entering the service that was provided to the client. Then the program will add the sale to the sales page and the revenue from the sale to the revenue page. The revenue page will then show the sale under the specific service revenue and the total revenue.
